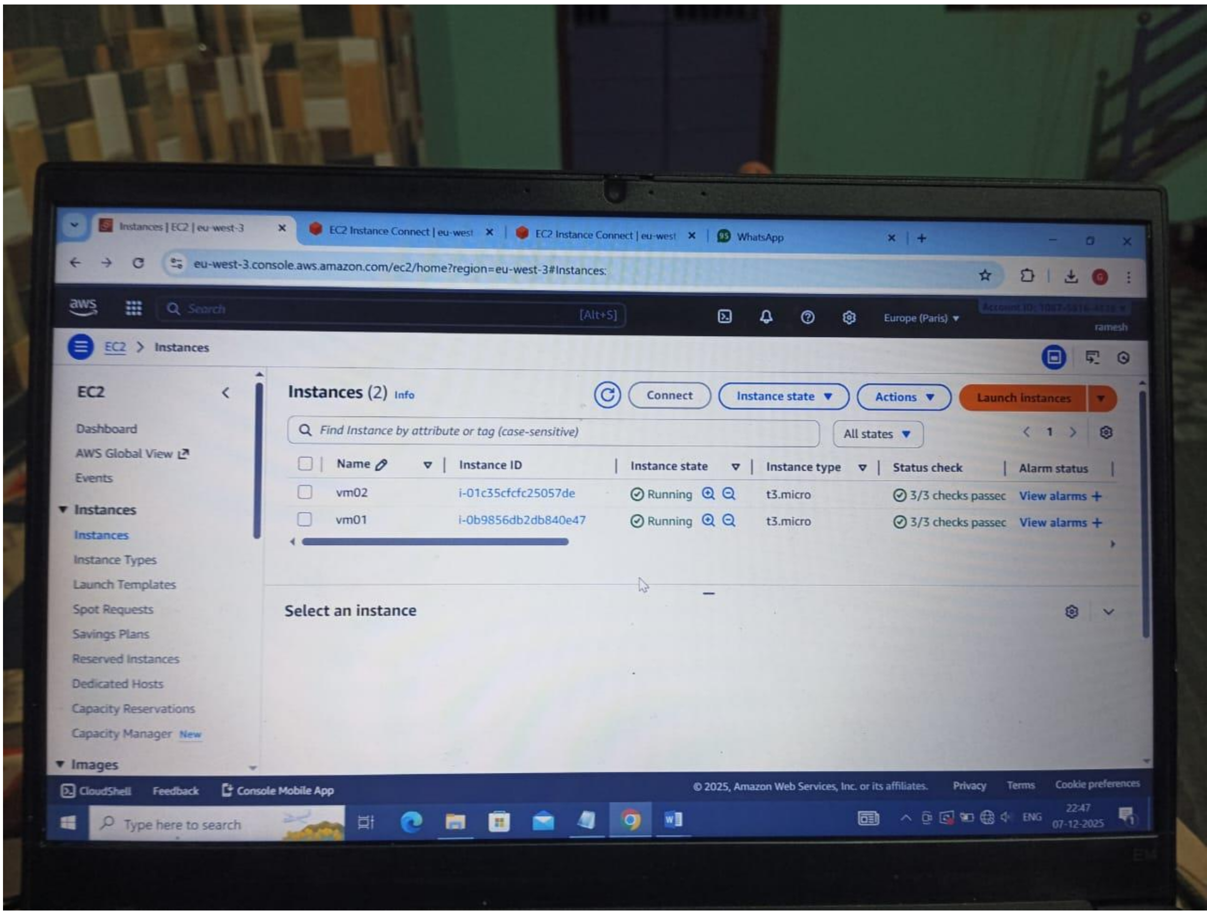
Tasks:

1. Initial Setup and Directory Structure (Instance 1)

- Launch two EC2 instances (Instance 1 and Instance 2) in the same region using a Linux AMI (e.g., Ubuntu 20.04 or Amazon Linux 2).
- Ensure both instances can communicate with each other by configuring the security groups to allow SSH
- SSH into Instance 1 and create a directory structure in your home directory called project_setup with the following subdirectories:
    - data
    - backups
    - logs
    - temp

      scripts
- Launch two EC2 instances (Instance 1 and Instance 2) in the same region using a Linux AMI (e.g., Ubuntu 20.04 or Amazon Linux 2).



- Ensure both instances can communicate with each other by configuring the security groups to allow SSH

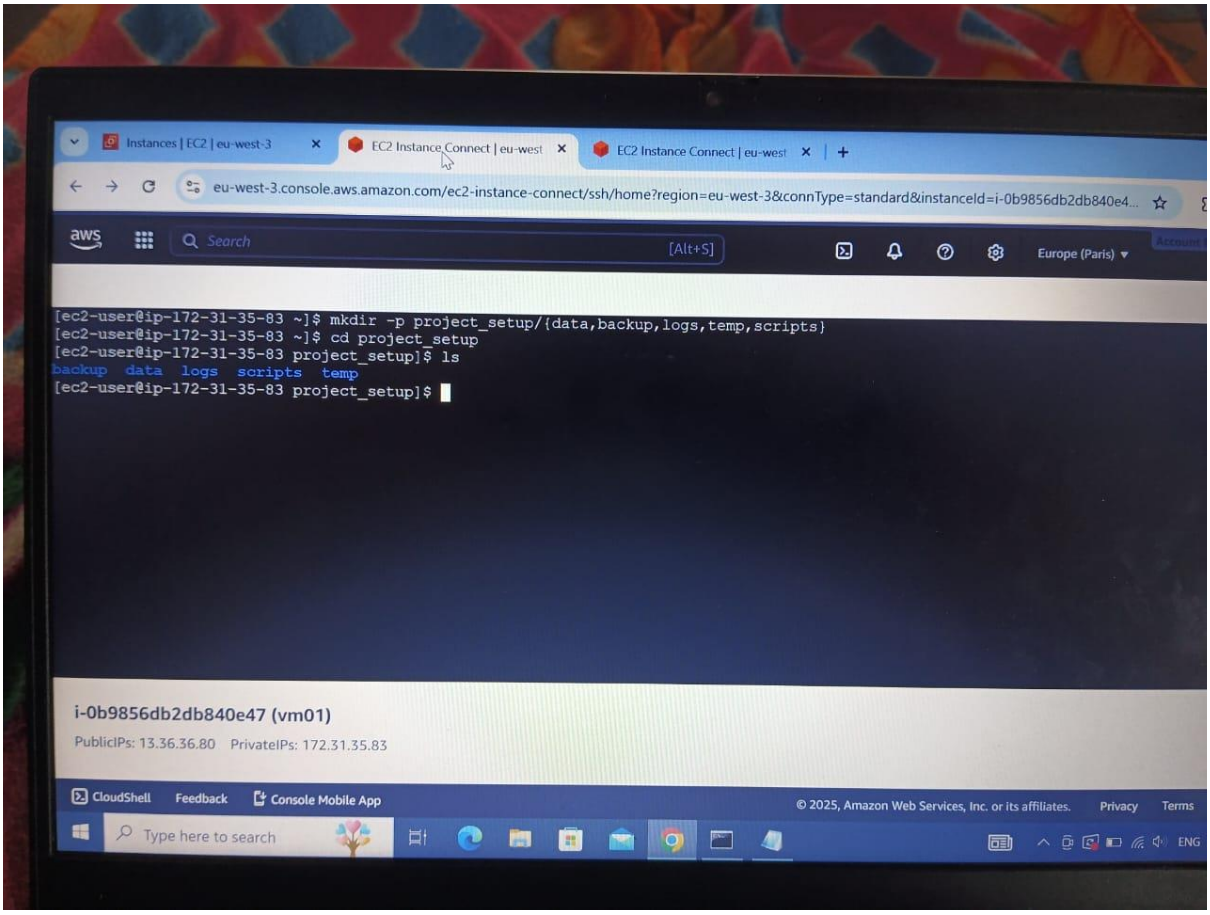
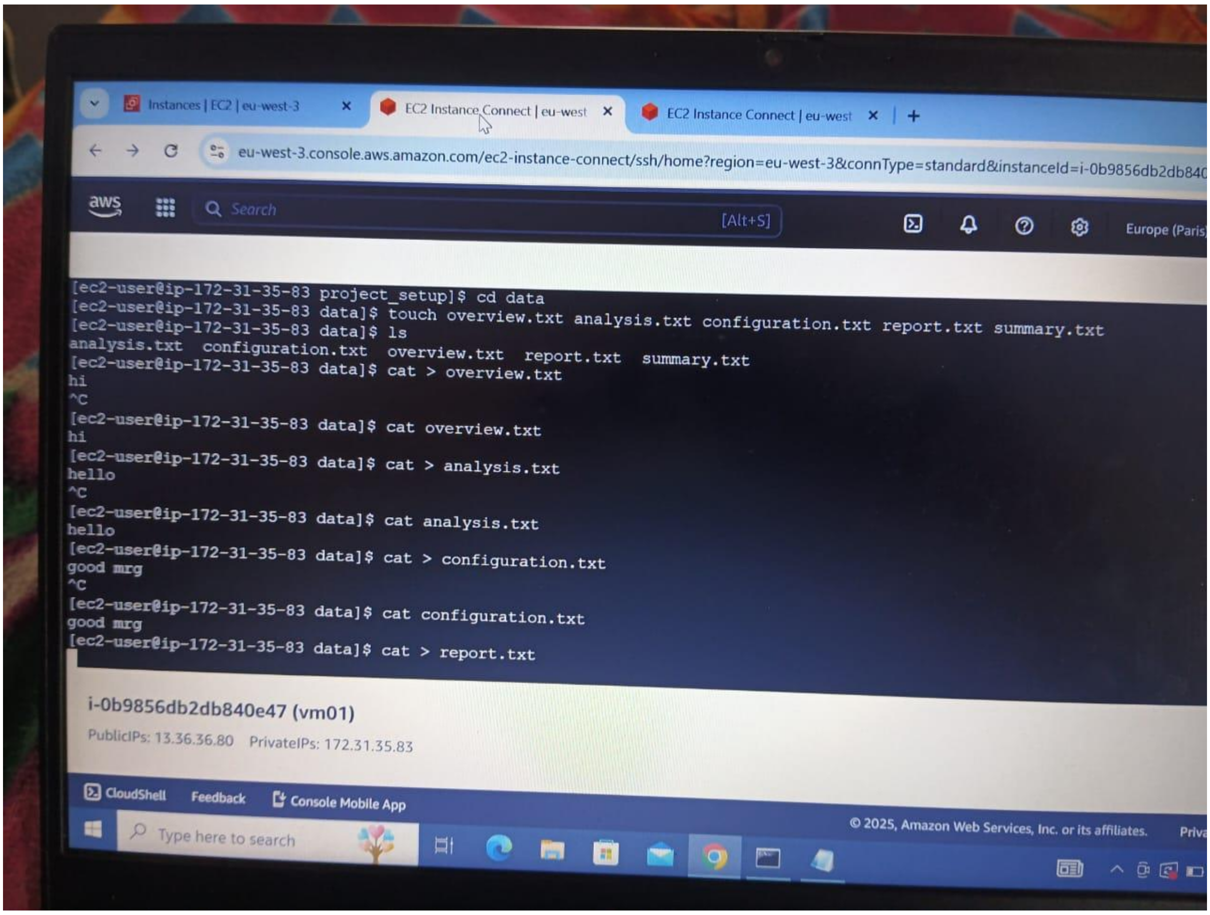
- SSH into Instance 1 and create a directory structure in your home directory called project_setup with the following subdirectories:
    - data
    - backups
    - logs
    - temp
    - scripts



2. File Creation and Content Population (Instance 1)

- Inside the data directory, create five text files named:
    - overview.txt
    - analysis.txt
    - configurations.txt
    - report.txt
    - summary.txt
- Populate each file with content using the echo or cat commands.



3. File Operations and Management (Instance 1)

- Copy overview.txt from the data directory to the backups directory.
- Move report.txt from data to logs.
- Rename analysis.txt to analysis_backup.txt in the data directory.
- Create a new file archive.txt in the data directory.
- Append content to archive.txt using output redirection (e.g., echo "Backup process started." >> archive.txt).

4. File Permissions and Ownership (Instance 1)

- Set the permissions of overview.txt to be readable and writable by the owner, and readable by others.
- Change the ownership of configurations.txt to a user named admin.
- Set the group ownership of summary.txt to a group named project_team.
- Set ACLs so that a user named guest has read and write permissions on report.txt.
- Remove ACL entries from report.txt.
- Use the ls -l and getfacl commands to verify the permissions and ownership.

5. User and Group Administration (Instance 1)

- Create a user named admin_user.
- Create a group named project_team.
- Add admin_user to the project_team group.
- Create another user named guest_user and add guest_user to a new group called guest_group.
- Verify that the users and groups were created correctly and that the memberships are accurate by using the id and groups commands.

6. Partitions and LVM Configuration (Instance 1)

- Check the current partitions and details using lsblk or fdisk -l.
- Create a new partition (if applicable), initialize it as an LVM physical volume, and name the partition /dev/sdb1 (or a similar available device).
- Create a volume group named vg_data using the new partition.
- Create a logical volume named lv_data_backup of size **500MB** within the volume group.
- Format the logical volume with the **xfs** file system and mount it to data_backup.
- Verify the mounted logical volume using df -h.
- Increase the logical volume size to 1GB.

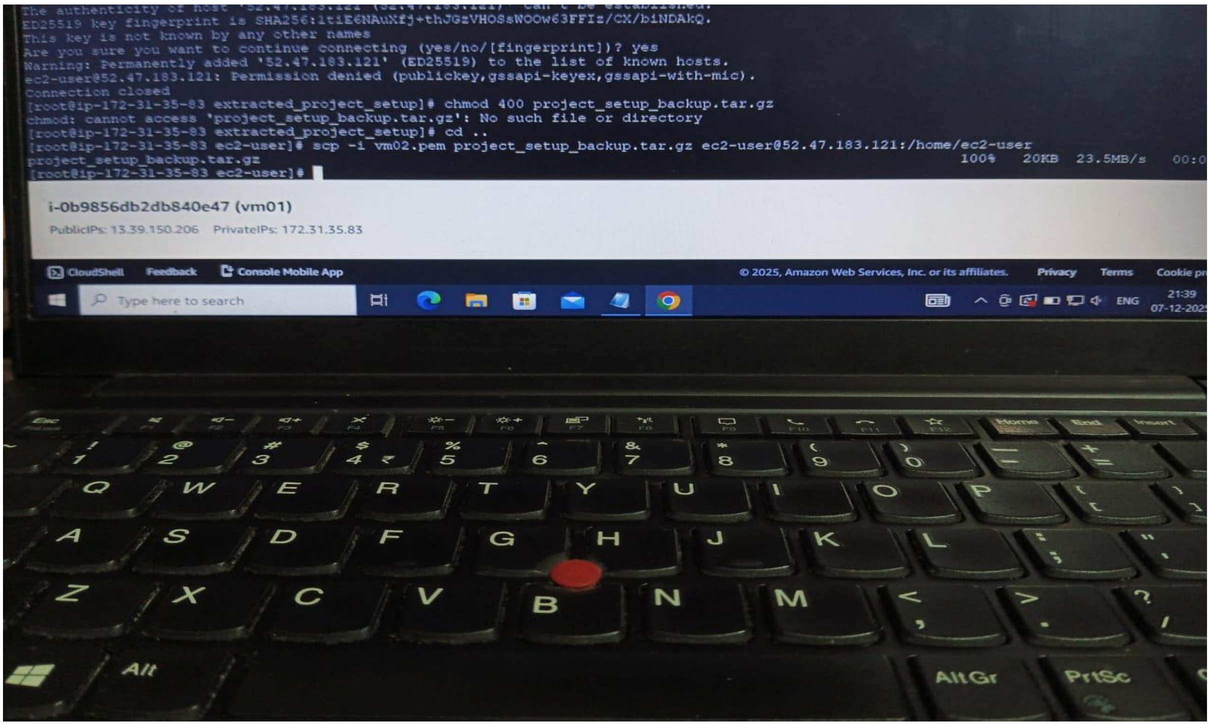
9. File Transfer Between Instances Using SCP

- From Instance 1, use **SCP** to copy the project_setup_backup.tar.gz file to Instance 2:
- SSH into Instance 2 and verify the transfer by listing the file:



ED25519 key fingerprint is SHA256:ltiE6NAuXfj+thJGzVHOSsWOOw63FFIz/CX/biNDAkQ.
This key is not known by any other names
Are you sure you want to continue connecting (yes/no/[fingerprint])? yes
Warning: Permanently added '52.47.183.121' (ED25519) to the list of known hosts.
ec2-user@52.47.183.121: Permission denied (publickey,gssapi-keyex,gssapi-with-mic).
Connection closed
[root@ip-172-31-35-83 extracted_project_setup]# chmod 400 project_setup_backup.tar.gz
chmod: cannot access 'project_setup_backup.tar.gz': No such file or directory
[root@ip-172-31-35-83 extracted_project_setup]# cd ..
[root@ip-172-31-35-83 ec2-user]# scp -i vm02.pem project_setup_backup.tar.gz ec2-user@52.47.183.121:/home/ec2-user
project_setup_backup.tar.gz 100% 20KB 23.5MB/s
